leadership experience
begins with

Going Global: Economics, Engineering, Environment

EGR 291 Fall 2009

Globalization is an old process that is reaching a new state of intensity and speed in the 21st century. Increased economic development and the negative response of our environment together are changing engineering practice – providing exciting challenges in building sustainable global systems for communication, energy, food, manufacturing, security, transportation, and water. Your career in design, sales, management, or research will be impacted by globalization, so join us as we consider ways in which economic systems, engineering systems and environmental systems are interacting. An outstanding group of guest speakers will increase your understanding and broaden your perspective as you wrestle with these significant issues. You will have a chance to build your communication, teaming and networking skills as part of an active learning community.

- **GLOBALIZATION** is ‘On the March’
- **ECONOMICS** drives it
- **ENGINEERING** enables it
- **Our ENVIRONMENT** constrains it

- We meet Tuesdays and Thursdays from 10:20-11:40.
- We meet in 1220 Engineering Building.
- Three credits are awarded.
