Report on the EUSC 2009-2010

The EUSC spent most of its time on the task of reviewing the many curricular changes that occur as the various programs evolve.

One of the most significant issues that the committee attended to was the set of proposed changes to the Applied Engineering Sciences program. Under the leadership of Dr. Sticklen a set of improvements including new courses were proposed and approved. Of particular interest was the discussion of the role of the program in the college because its combination of business and engineering courses makes it look so different from other programs. Issues discussed included: should it be housed in a department, should it have its own faculty, should it be accredited, where does it fit in accreditation, should there be more engineering courses?
