1-13-14: IEEE Press release:
Dean Aslam, IEEE Senior Member and professor of Electrical and Computer Engineering at Michigan State University, explained that, “through use of wearable Microsystems equipped with inexpensive and non-invasive brainwave and muscle sensors, we will be able to set specific patterns and thoughts to turn on ceiling fans, appliances or even lights. When you get cold, all you’ll need to do is blink your left eye twice or think about raising the temperature on the thermostat and you’ll warm right up. If you go to sleep without switching off lights and TV, they will be automatically switched off the moment the sensors find you in the state of sleep.”
