Course roadmap

2008 Fall

2

What is DC motor?

An actuator, converting electrical energy into rotational mechanical energy

(You will see DC motor during Lab 1 and 4.)

Why DC motor?

- Advantages:
 - high torque
 - speed controllability
 - portability, etc.
- Widely used in control applications: robot, tape drives, printers, machine tool industries, radar tracking system, etc.
- Used for moving loads when
 - Rapid (microseconds) response is not required
 - Relatively low power is required

How does DC motor work?

2008 Fall

5

Model of DC motor

“a” : armature
 e_a : applied voltage
 i_a : armature current
 “b” : back EMF

mechanical
 θ : angular position
 ω : angular velocity
 J : rotor inertia
 B : viscous friction

2008 Fall

6

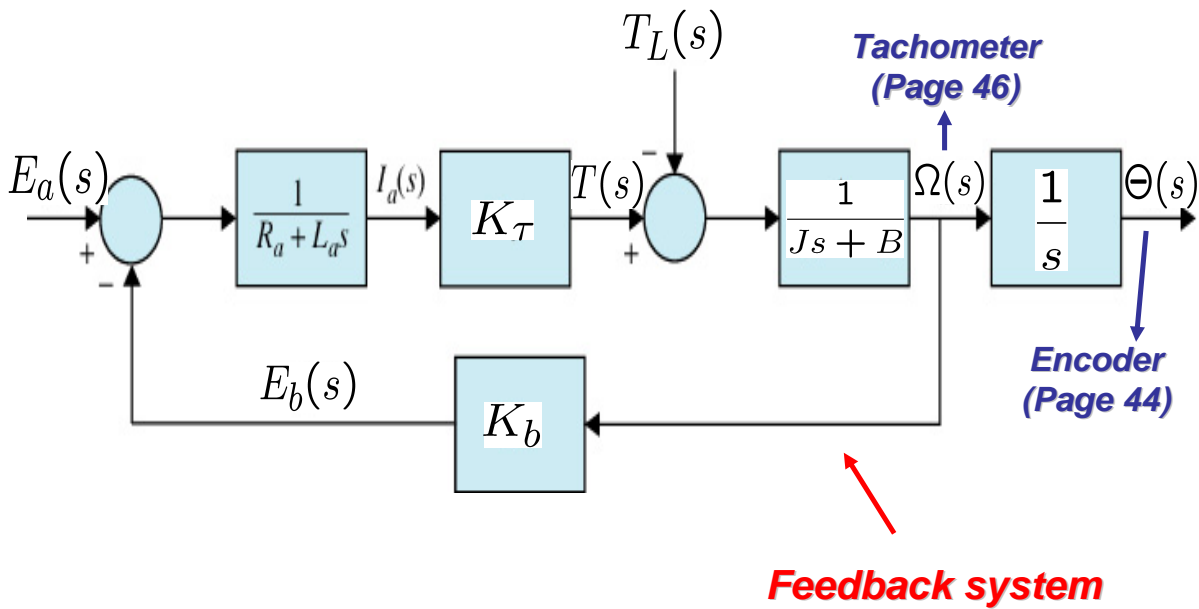

Modeling of DC motor: time domain

- Armature circuit $e_a(t) = R_a i_a(t) + L_a \frac{di_a(t)}{dt} + e_b(t)$
- Connection between mechanical/electrical parts
 - Motor torque $\tau(t) = K_\tau i_a(t)$
 - Back EMF $e_b(t) = K_b \omega(t)$
- Mechanical load $J\ddot{\theta}(t) = \tau(t) - B\dot{\theta}(t) - \tau_l(t)$

- Angular position $\omega(t) = \dot{\theta}(t)$

Modeling of DC motor: s-domain

- Armature circuit $I_a(s) = \frac{1}{R_a + L_a s} (E_a(s) - E_b(s))$
- Connection between mechanical/electrical parts
 - Motor torque $T(s) = K_\tau I_a(s)$
 - Back EMF $E_b(s) = K_b \Omega(s)$
- Mechanical load $\Omega(s) = \frac{1}{J s + B} (T(s) - T_L(s))$
- Angular position $\Theta(s) = \frac{1}{s} \Omega(s)$

DC motor: Block diagram

9

Useful formula for feedback

Negative feedback system

$$Y(s) = G(s)(R(s) - H(s)Y(s)) \quad \Rightarrow \quad (1 + G(s)H(s))Y(s) = G(s)R(s)$$

$$\Rightarrow \frac{Y(s)}{R(s)} = \frac{F_g}{1 - L_g} = \frac{G(s)}{1 + G(s)H(s)}$$

Memorize this!

$G(s)$:	forward gain
$G(s)H(s)(-1)$:	loop gain

2008 Fall

10

Ex: Derivation of transfer functions

Compute transfer functions from $R(s)$ to $Y(s)$.

2008 Fall

11

DC motor: Transfer functions (TF)

$$\frac{\Omega(s)}{E_a(s)} =$$

$$\frac{\Omega(s)}{T_L(s)} =$$

2nd order system

$$\rightarrow \Omega(s) = G_1(s)E_a(s) + G_2(s)T_L(s)$$

$$\rightarrow \Theta(s) = \frac{1}{s}\Omega(s) = \frac{1}{s}(G_1(s)E_a(s) + G_2(s)T_L(s))$$

2008 Fall

12

DC motor: Transfer functions (cont'd)

Note: In many cases $L_a \ll R_a$. Then, an approximated TF is obtained by setting $L_a=0$.

$$\begin{aligned}\frac{\Omega(s)}{E_a(s)} &= \frac{K_\tau}{(L_a s + R_a)(Js + B) + K_b K_\tau} \approx \frac{K_\tau}{R_a(Js + B) + K_b K_\tau} \\ &=: \frac{K}{Ts + 1} \quad \left(K := \frac{K_\tau}{R_a B + K_b K_\tau}, T = \frac{R_a J}{R_a B + K_b K_\tau} \right) \\ &\quad \text{2nd order system} \implies \text{1st order system}\end{aligned}$$

$$\frac{\Theta(s)}{E_a(s)} = \frac{K}{s(Ts + 1)}$$

Summary and Exercises

- Modeling of DC motor
 - What is DC motor and how does it work?
 - Derivation of a transfer function
 - Block diagram with feedback
- Next
 - **Stability** of linear control systems, one of the most important topics in feedback control
- Exercises
 - Read Section 2.7, 2.8.
 - Go over the derivation for DC motor transfer functions by yourself. Obtain $T(s)/E_a(s)$.

Main message until this point

*Many systems
can be represented
as **transfer functions!***

Using the transfer functions,
(to be continued)
