

ME451: Control Systems

Lecture 23

Bode diagram of simple systems

Dr. Jongeun Choi
 Department of Mechanical Engineering
 Michigan State University

Course roadmap

Frequency response (review)

- Steady state output $y_{ss}(t) = A|G(j\omega)| \sin(\omega t + \angle G(j\omega))$
 - Frequency is same as the input frequency ω
 - Amplitude is that of input (A) multiplied by $|G(j\omega)|$
 - Phase shifts $\angle G(j\omega)$

- Frequency response function (FRF): $G(j\omega)$
- Bode plot: Graphical representation of $G(j\omega)$

Bode plot of $G(j\omega)$ (review)

- Bode plot consists of gain plot & phase plot

Sketching Bode plot

- Basic functions (Today)
 - Constant gain
 - Differentiator and integrator
 - Double integrator
 - First order system and its inverse
 - Second order system
 - Time delay
- Product of basic functions (Next lecture)
 1. Sketch Bode plot of each factor, and
 2. Add the Bode plots graphically.

Main advantage of Bode plot!

5

Bode plot of a constant gain

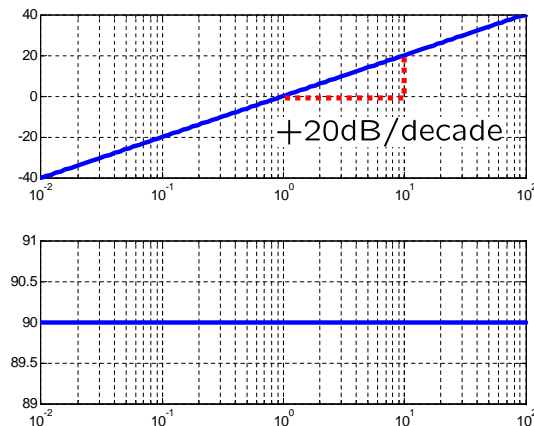

- TF $G(s) = K \Rightarrow |G(j\omega)| = K, \angle G(j\omega) = 0^\circ, \forall \omega$

6

Bode plot of a differentiator

- TF $G(s) = s \Rightarrow |G(j\omega)| = \omega, \angle G(j\omega) = 90^\circ, \forall \omega$

7

Bode plot of an integrator

- TF $G(s) = \frac{1}{s} \Rightarrow |G(j\omega)| = \frac{1}{\omega}, \angle G(j\omega) = -90^\circ, \forall \omega$

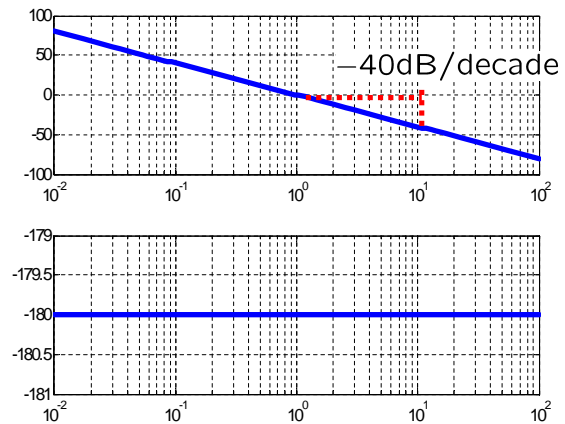

Mirror image of the bode plot of $1/s$ with respect to ω -axis.

8

Bode plot of a double integrator

- TF $G(s) = \frac{1}{s^2} \Rightarrow |G(j\omega)| = \frac{1}{\omega^2}, \angle G(j\omega) = -180^\circ, \forall \omega$

9

Bode plot of a 1st order system

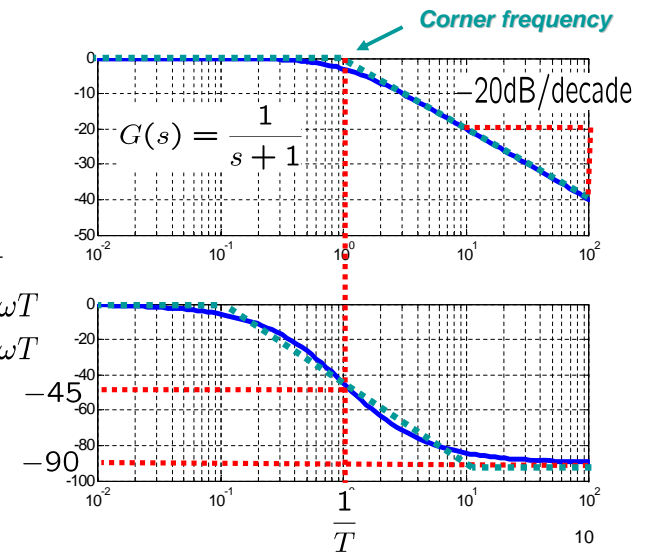

- TF

$$G(s) = \frac{1}{Ts + 1}$$

$$G(j\omega) = \frac{1}{j\omega T + 1}$$

$$\approx \begin{cases} 1 & \text{if } 1 \gg \omega T \\ \frac{1}{j\omega T} & \text{if } 1 \ll \omega T \end{cases}$$

..... Straight line approximation

Bode plot of an inverse system

- TF $G(s) = Ts + 1 = \left(\frac{1}{Ts + 1}\right)^{-1}$

Mirror image of the original bode plot with respect to ω -axis.

11

Bode plot of a 2nd order system

- TF

$$G(s) = \frac{\omega_n^2}{s^2 + 2\zeta\omega_n s + \omega_n^2}$$

- Resonant freq

$$\omega_r := \omega_n \sqrt{1 - 2\zeta^2}$$

- Peak gain

$$\frac{1}{2\zeta\sqrt{1 - \zeta^2}} \approx \frac{1}{2\zeta}$$

if ζ is small

12

Bode plot of a time delay

- TF $G(s) = e^{-Ts} \Rightarrow |G(j\omega)| = 1, \forall \omega, \angle G(j\omega) = -\omega T(\text{rad})$

Huge phase lag!

As can be explained with Nyquist stability criterion, this phase lag causes instability of the closed-loop system, and hence, the difficulty in control.

13

Remark

- Use Matlab "bode.m" to obtain precise shape.
- ALWAYS check the correctness of
 - Low frequency gain (DC gain) $G(0)$
 - High frequency gain $G(\infty)$
- Example $G(s) = \frac{10(s+1)}{s+5}$

14

Exercises

- Sketch bode plot.

$$G(s) = 1 \quad G(s) = 0.1 \quad G(s) = -10$$

$$G(s) = s^2 \quad G(s) = s^3 \quad G(s) = \frac{1}{s^3}$$

$$G(s) = \frac{1}{10s+1} \quad G(s) = \frac{10}{s+10} \quad G(s) = 10s+1$$

$$G(s) = 2s+1 \quad G(s) = \frac{s}{5}+1 \quad G(s) = \frac{4}{s^2+2s+4}$$

15

Summary

- Bode plot of various simple transfer functions.
 - Constant gain
 - Differentiator, integrator
 - 1st order and 2nd order systems
 - Time delay
- Sketching Bode plot is just
 - to get a rough idea of the characteristic of a system.
 - to interpret the result obtained from computer.
 - to detect erroneous result from computer.
- Next, Bode plot of connected systems

16
