LM566C Voltage Controlled Oscillator

General Description
The LM566CN is a general purpose voltage controlled oscillator which may be used to generate square and triangular waves, the frequency of which is a very linear function of a control voltage. The frequency is also a function of an external resistor and capacitor.
The LM566CN is specified for operation over the 0°C to +70°C temperature range.

Features
- Wide supply voltage range: 10V to 24V
- Very linear modulation characteristics
- High temperature stability
- Excellent supply voltage rejection
- 10 to 1 frequency range with fixed capacitor
- Frequency programmable by means of current, voltage, resistor or capacitor

Applications
- FM modulation
- Signal generation
- Function generation
- Frequency shift keying
- Tone generation

Connection Diagram
Dual-In-Line Package

Order Number LM566CN
See NS Package Number N08E

Typical Application
1 kHz and 10 kHz TTL Compatible Voltage Controlled Oscillator

©1995 National Semiconductor Corporation
Absolute Maximum Ratings
If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.
Power Supply Voltage 26V
Power Dissipation (Note 1) 1000 mW
Operating Temperature Range, LM566CN 0°C to +70°C
Lead Temperature (Soldering, 10 sec.) +260°C

Electrical Characteristics $V_{CC} = 12V$, $T_A = 25°C$, AC Test Circuit

Note 1: The maximum junction temperature of the LM566CN is 150°C. For operation at elevated junction temperatures, maximum power dissipation must be derated based on a thermal resistance of 115°C/W, junction to ambient.

Applications Information
The LM566CN may be operated from either a single supply as shown in this test circuit, or from a split ($\pm$) power supply. When operating from a split supply, the square wave output (pin 3) is TTL compatible (2 mA current sink) with the addition of a 4.7 kΩ resistor from pin 3 to ground.

A 0.001 μF capacitor is connected between pins 5 and 6 to prevent parasitic oscillations that may occur during VCO switching.

$$f_O = \frac{2.4(V^+ - V_5)}{R_O C_O V^+}$$

where

$2k < R_O < 20k$

and $V_5$ is voltage between pin 5 and pin 1.
